DISTRIBUTED PV GENERATION + ESS

Overview

The answer is yes - solar power can work well even in these conditions. That's because the clouds diffract the sunlight, which means more sunlight is scattered across a wider area. Fog isn't just a harmless mist—it can scatter and block sunlight, making it tricky for solar panels to soak up energy. Key Fact: Even on a fully overcast day, about 10-20% of the sun's energy still reaches. The short answer is yes, solar panels are still effective during cloudy days, even though there are some impacts on their efficiency. Under cloudy and rainy weather conditions, PV power production drops 40 - 90 % depending on how dark and heavy the rain and clouds are. However, their efficiency will be a bit less.
