

# Fengjun5 generator overheating

## Overview

---

There are several reasons a generator overheats, but it is typically due to low oil pressure, bad fuel, poor air circulation, overloading the wattage, or damaged parts. Left unchecked, it can damage your engine and shorten your generator's life. Here's how to spot the problem early and fix it right. Prioritize Regular Maintenance: Scheduling routine maintenance, such as oil changes and air filter replacements, can. Overheating occurs when a generator's engine runs at a temperature higher than its design parameters. Engines are designed to operate within a specific thermal range; when that threshold is exceeded, performance declines, and damage can occur. Most generators have built-in sensors that monitor. Though diesel generators are known for their efficiency and long life span, they can also undergo different problems being a mechanical equipment like generator overheating, wear & tear, lubrication loss and decrease of overall efficiency overtime.
