

# Look at the journey of this photovoltaic panel to generate electricity

## Overview

---

Once photons set the electrons loose in a solar cell, metal contacts on the edges of the cell collect the freed electrons and transfer them to the wires. They use this sunlight to create direct current (DC) electricity through a process called "the photovoltaic effect. Solar power on Earth begins about 93 million miles away. Way out in space there's a gargantuan ball made up of gas, mostly helium and hydrogen. There are many PV cells within a single solar panel, and the current created by all of the cells. Solar panels, also known as photovoltaic (PV) panels, consist of several components that work together to convert sunlight into electricity.
