

Polysilicon rods for photovoltaic panels

Overview

It is the primary feedstock material used for the production of solar cells today. Polysilicon feedstock generally consists of large rods which are broken into chunks or chips of various size, then cast into multicrystalline ingots. Polycrystalline silicon, or multicrystalline silicon, also called polysilicon, poly-Si, or mc-Si, is a high purity, polycrystalline form of silicon, used as a raw material by the solar photovoltaic and electronics industry. Polysilicon is produced from metallurgical grade silicon by a chemical. Those systems are comprised of PV modules, racking and wiring, power electronics, and system monitoring devices, all of which are manufactured. Read the Solar Photovoltaics Supply Chain Review, which explores the global solar PV supply chain and opportunities for developing U. The role of polysilicon in solar cells, how it plays a vital role in photovoltaic technology, and advancements in polysilicon production.
