

Solar inverter dual-loop control

Overview

The converter is integrated into a PV-based energy system and regulated by a dual-loop control strategy consisting of a Proportional-Integral (PI) voltage controller and an inner Sliding-Mode Controller (SMC) for current regulation. This paper presents a novel partial-power DC-DC converter architecture specifically designed for Photovoltaic (PV) energy systems. To address the issue of high Total Harmonic Distortion (THD) in three-phase grid-tied. Traditional control methods, like single-sequence double-loop control, often fail to address negative-sequence voltages, resulting in asymmetric outputs. In this article, we explore a dual-sequence control strategy that effectively mitigates voltage asymmetry by incorporating negative-sequence. An international research team has conceived a dual-component controller for three-phase inverters that can reportedly achieve faster settling times, reduced overshoot and more stable current tracking compared to conventional controllers. A group of researchers led by the Jouf University in Saudi.
