

Solar power generation is not stored for own use

Overview

Solar energy is primarily captured as electricity using photovoltaic (PV) cells. Unlike fossil fuels, which are physical substances that can be stored and burned when needed, electricity must either be used immediately or converted into another form of energy to store it. Solar power systems generate electricity by converting sunlight into. Solar panels produce electricity only during daylight hours, and their efficiency depends on weather conditions. Storing solar energy seems like the obvious solution to bridge this gap, but it's not as simple as it sounds. You may be surprised, but contrary to some common misconceptions, solar panels do not actually store energy.

Fuels Virtual Storage Energy can also be
stored by changing how we use the
devices we already have. For example,
by heating or cooling a building before
an anticipated peak of electrical
demand, the building can "store" that
thermal energy so it doesn't need to
consume electricity later in the day. The
building itself is acting as a thermos by
storing cool or warm air. See more on
