

Solar related to solar panels

Overview

Photovoltaic arrays usually involve solar panels, a collection of dozens or even hundreds of solar cells. Each solar cell contains a semiconductor, usually made of silicon. Solar energy technologies and power plants do not produce air pollution or greenhouse gases when operating. Using solar energy can have a positive, indirect effect on the environment when solar energy replaces or reduces the use of other energy sources that have larger effects on the environment. You probably already know that solar panels use the sun's energy to generate clean, usable electricity. They use this sunlight to create direct current (DC) electricity. There are two forms of energy generated from the sun for our use - electricity and heat.
