Overview

The government has approved a 2035 greenhouse gas reduction plan, aiming for a 60.8% cut in transport emissions from 2018 levels. To meet these goals, South Korea plans for EVs and hydrogen vehicles to make up over 40% of new car sales by 2030 and more than 70% by 2035. It is also expanding charging infrastructure. An empirical analysis of new vehicle registrations from 2019 to 2022 shows that investing in charging facilities is more cost-effective than offering purchase incentives for increasing BEV adoption. With over \$448 million allocated for this purpose, the breakdown shows a diverse and growing electric fleet: This achievement also boosted EV penetration in the automotive market, with EVs accounting for 18–20% of new car sales by mid-2025 — a clear indication that electric mobility is becoming mainstream. Being one of the top automakers in the world, South Korea has implemented the electric vehicle (EV) policy, also known as the eco-friendly vehicle policy, to reduce greenhouse gas. South Korea is emerging as a leader in the electric vehicle (EV) industry, showcasing robust growth trends and a landscape that attracts both domestic and international stakeholders. This analysis delves into the intricacies of the current state of the EV market, examining the multifaceted factors.
