

# The photovoltaic inverter fan keeps working

## Overview

---

Inverter cooling fans run when the inverter is charging a battery or loading appliances, and if there is insufficient power the fan will stop working. Turned all breakers off, still kept running the fan. Fan ran straight for 20 min until I pulled. There are several reasons your inverter's fan might constantly run. Temperature Control (Overheating Prevention) Modern inverters are equipped with internal temperature sensors. This system is really starting. For the inverter, once the external cooling fan fails (the fan is blocked and does not rotate, or an animal bites the power supply cable), this in turn causes poor heat dissipation of the inverter and induces over-temperature protection.
