

Too many photovoltaic panels in series

Overview

Overloading: Connecting too many solar panels can overload the inverter, causing it to malfunction or shut down due to excess current. Let's explore the key factors that will help you make the right choice. Solar panel system size is generally the main consideration. The number of solar panels in. Connecting more than one solar panel in series, in parallel or in a mixed-mode is an effective and easy way not only to build a cost-effective solar panel system but also helps us add more solar panels in the future to meet our increasing daily needs for electricity. If you exceed the inverter's rated input capacity, you risk damaging the inverter, reducing its lifespan, or causing it to shut down. Configuring the right number of panels in series and parallel is essential to take full advantage of your MPPT. The MPPT has a specific voltage range where it performs best. Staying within this range means you'll get the highest throughput and efficiency. But should you wire them in series, parallel, or a combination of both?

This guide explains the differences, when to use each method, and how to wire them safely.

Mixed Wiring of Solar Panels
As we said above, when connecting solar panels in series, we get an increased wattage in combination with a higher voltage. Such 'higher voltage' means that series connection is more often applied in grid-tied solar systems where: 1) the system voltage is often at least 24 volts, and 2) the solar array output voltage is fed to an inverter or charge See more on
