

Ventilation structure of air-cooled solar battery cabinet

Overview

In air-cooled energy storage systems (ESS), the air duct design refers to the internal structure that directs airflow for thermal regulation of battery modules. This ventilation setup plays a key role in preventing overheating, enhancing battery life, and supporting stable system operation. A case study involving six existing battery rooms has been performed to investigate design. The battery rooms must be adequately ventilated to prohibit the build-up of hydrogen gas. During normal operations, off gassing of the batteries is relatively small.
