

Water-cooled energy storage system quality standards

Overview

This guide includes visual mapping of how these codes and standards interrelate, highlights major updates in the 2026 edition of NFPA 855, and identifies where overlapping compliance obligations may arise. Equipment type is categorized as water or air-cooled, which refers to the method used for cooling the refrigerant in the condenser. Per the prescriptive requirements in Section 140. Electrochemical energy storage has a reputation for concerns regarding the ventilation of hazardous gases, poor reliability, short product life, and safety. Lithium-ion battery technologies, the traditional lead-acid technology has developed a reputation for exceeding energy code minimum requirements. A comprehensive approach to system design can minimize the power draw of the entire system and are inherently easier to control for highest efficiency, lower first costs and lower energy costs. Right-sizing equipment means smaller electrical connections—a great benefit. Some parts in a water-cooled IT system will be specific to the product design, such as cold plates, manifolds, arrangement of piping, pumps, valves, and so on, but others such as quick connectors, hoses, hose connections, materials, and water chemistry fall more into the category of common parts. NFPA is keeping pace with the surge in energy storage and solar technology by undertaking initiatives including training, standards development, and research so that various stakeholders can safely embrace renewable energy sources and respond if potential new hazards arise.
