

What are the communication technologies that do not require base stations

Overview

Radio links without infrastructure refer to wireless communication systems that establish direct connections between devices or locations without the need for intermediary infrastructure such as cell towers, fiber-optic cables, or satellites. However, many regions still lack the necessary infrastructure to support traditional communication systems. These systems provide a vital solution for enabling communication in remote or underserved areas without relying on existing. The present-day tele-space is incomplete without the base stations as these constitute an important part of the modern-day scheme of wireless communications. They are referred to as cell towers or cellular antennas. This textbook takes a unified view of the fundamentals of wireless communication and explains the web of concepts underpinning these advances at a level accessible. The following decades brought 3G, 4G, and now 5G technologies, which enabled the use of high-speed mobile internet, video streaming, and the development of applications and services on an unprecedented scale. Explore wireless communication, Wi-Fi calling, mobile data, satellite communication, VoIP, messaging apps, social media, email, and virtual phone numbers. Stay connected in today's digital world.
