

What is the radius of the wind turbine blades

Overview

According to The United States Department of Energy, most modern land-based wind turbines have blades of over 170 feet (52 meters). This means that their total rotor diameter is longer than a football field. The height. Haliade-X is like a tower 248 meters high, but from the base to the tip of the wings, the turbine must be up to 260 meters high. Because of its huge size, Haliade-X can power a house for 2 days with. The sweep area of a wind turbine is calculated by squaring the rotor radius (R) times pi (3).
