

# What photovoltaic panels should restaurants use

## Overview

---

Depending on the monthly consumption, you will need between 30-40 panels for a 10kW system to 380-410 panels for a 100kW system. Quick-service restaurants (QSRs) are among the most energy-intensive in the United States. When buildings have the ability with solar panel rooftops to create their own electricity and store it, it can significantly reduce, if not potentially eliminate, food waste. According to the National Restaurant Association, a typical restaurant uses approximately 38 kilowatt-hours (kWh) of electricity and 111 cubic feet of natural gas per square foot annually, resulting in thousands of dollars in monthly utility expenses that directly impact their bottom line. The Space: Most restaurants we work with typically have flat roofs with soffits for aesthetic purposes that would shield a solar installation. The absence of any negative impacts when generating electricity using solar panels is an indisputable advantage of such systems. Now you can shorten the periods of outages, if not eliminate them.
