

What systems do wind turbines have

Overview

Wind turbines work on a simple principle: instead of using electricity to make wind—like a fan—wind turbines use wind to make electricity. Wind turns the propeller-like blades of a turbine around a rotor, which spins a generator, which creates electricity. Wind is a form of solar energy caused by a.

Exponential Growth in Scale: Modern wind turbines have evolved into massive machines with offshore turbines exceeding 15 megawatts in capacity and prototype machines reaching 20+ megawatts, featuring rotor diameters approaching 800 feet that can power up to 20,000 homes each.

Generally, efficiency increases along with turbine blade lengths. The blades must be stiff, strong, durable, light and resistant to fatigue. Materials with these properties include composites such as polyester and epoxy, while glass fiber and carbon fiber have been used for the reinforcing. Construction may involve manual layup or injection molding. Retrofitting existing turbines with larger blades reduces the task and risks o...
