

# Wind blade power generation facilities

## Overview

---

Wind power plants, commonly known as wind farms, consist of multiple wind turbines that convert the kinetic energy of wind into electrical energy. Wind energy has become one of the most powerful symbols of sustainable progress, capturing nature's invisible force and transforming it into electricity that fuels homes, industries, and cities around the world. The image of tall, graceful turbines turning against a blue sky evokes a sense of. The Wind Energy Technologies Office supports industry partnerships and targeted R&D funding that integrate new designs, materials, and processes into manufacturing facilities, thus making wind turbines a more affordable domestic energy source for communities around the country. There are two types of wind power generation facilities: onshore and offshore. Wind flows over the blades creating lift (similar to the effect on airplane wings), which causes the blades to turn.
