

Wind metering system for micro-generation

Overview

Net metering allows customers to generate their own electricity from solar power, small wind turbines, or small-scale hydro. Why Wind?

Wind is one of the great renewable energy resources on the planet because it is in limitless supply. The electricity is used by the customer. A net meter measures the difference. Microgeneration is the small-scale production of heat or electric power from a "low carbon source," as an alternative or supplement to traditional centralized grid-connected power. What types of Micro-Generation qualify for Net Metering?

- Wind turbines, solar.

Microgeneration

Microgeneration is the small-scale production of heat or electric power from a "low carbon source," as an alternative or supplement to traditional centralized grid-connected power.

State-of-the-art review of micro to small-scale wind energy harvesting

The research evaluates advancements, applications, and technical features that optimise these technologies to function effectively in non-uniform wind flows and a wide range of wind speeds.

FACT SHEET: Micro-Generation

Several governing bodies are involved in connecting a micro-generation system to the electrical grid in Alberta. They ensure system safety, process approvals and manage administration.

Net metering for private solar and wind generation

Net metering allows customers to generate their own electricity from solar power, small wind turbines, or small-scale hydro. A net meter, provided by NorthWestern Energy, is needed to measure the energy ...

The Small Wind Turbine Standard

Since 2007, MCS has become the recognised Standard for UK products and their installation in the small-scale renewables sector. We create and maintain standards that allow for the certification of ...

WIND ENERGY METERING APPLICATIONS

The power produced by wind turbines normally involves several current conversions by inverters, along its way to the grid. thus, metering DC and AC current are both essential for monitoring inverter ...
