

# Wind turbine generator transformation

## Overview

---

Wind turbines use blades to collect the wind's kinetic energy. The blades are connected to a drive shaft that turns an electric generator, which produces. Wind turbines work on a simple principle: instead of using electricity to make wind—like a fan—wind turbines use wind to make electricity. Wind flows over the blades creating lift (similar to the effect on airplane wings), which causes the blades to turn. They are strategically positioned in areas with consistent wind flow—such as coastal regions, open plains, and offshore zones—to maximize efficiency. This process involves aerodynamic principles, mechanical amplification, and electromagnetic induction working in concert.
